GROG GOLD

SOFT FOOD SUPPLEMENT

1KG

COCCIDIOSIS AND ATOXOPLASMOSIS TREATMENT

One of the major problems in the breeding of passerines and ornamental birds today is the presence of diseases like coccidiosis and atoxoplasmosis. On a secondary level, we often observe viral or fungal infections such as circovirus ("Black Spot Disease") and "Megabacteria".

INDICATIONS

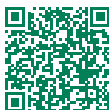

- Treatment and prevention of different types of coccidiosis and atoxoplasmosis in passerine and ornamental birds.
- Important support in preventing "Megabacteria" and Black Spot disease.

DOSAGE AND ADMINISTRATION

The powder is not soluble in water. Oral administration only via soft food/eggfood. Mix 20 grams of Grog Gold (= 6 measuring spoons) with one kg of prepared eggfood. Start adding the product one week before hatching of the first youngsters and continue daily throughout the whole breeding season until weaning.

Grog Gold doesn't contain antibiotics and can be perfectly combined with Starter Mix.

Prolonged administration has no influence on fertilisation.
