# STARTER MIX

(PREVIOUS FLAGELLAMIX)

**WATER SOLUBLE POWDER 100 G**

## MASTER FORMULA AGAINST DIARRHEA AND NEST MORTALITY

In aviculture, there are sometimes big losses of nestlings caused by bacterial diarrhea in the first week of life. The female breeding bird will often get a wet vent because of a dirty wet litter in the nest. One speaks then of the "sweating disease." The youngsters stop growing and die after a couple of days. It is possible to avoid all this by providing the nestlings a medication that prevents bacterial diarrhea. In collaboration with Pantex Holland, Dr. Coutteel has developed **Starter Mix**.

### INDICATIONS

- Prevention of nest mortality of young birds in their first week of life (canaries and finches).
- Treatment and prevention of bacterial infections causing diarrhea in birds (canaries & finches, small psittacines and exotic birds).

### DOSAGE AND ADMINISTRATION

Oral administration through the drinking water.

Mix 4 grams (1 measuring spoon) of Starter Mix with 1 litre drinking water.

- To prevent nest mortality of nestlings: administer daily during their first week of life.
- In the case of diarrhea: administer seven consecutive days as a curative treatment.
